Overview

Create a log parser that can:

- Read an access log file
- Resolve Country and State from IP address (IE MaxMind GeoLite2 Free)
- Translate useragent to device type (Mobile, Desktop, Tablet) and Browser (Safari, Chrome, etc)
- Combine new Geo & Device fields with existing fields on access log file and output/export a CSV

The goal of this test is to showcase your ability to leverage existing libraries without writing an exhaustive amount of code. Reach out to us if you need additional direction.

Below is a sample access log you can use if you don't have one. https://cti-developer-dropbox.s3.amazonaws.com/gobankingrates.com.access.log

Requirements

- Any libraries must be installed via a package manager
- Must be run from the cli
- Provide instructions on how to build and run
- Must be written in NodeJS

Bonus

- Do this all with Docker
- Unit Test
